

*The impact of the psychological  
comportment and personal  
characteristics on addictive  
substances consumption*

# Variables used for this study

- Personal Characteristics (Age, Education, Country...)
- Results of a psychological test (NEO-FFI-R) characterised by 5 values
- Consumption of all common addictive substances ( scaled on 6 levels of temporal consumption, from « Never consumed » to « Consumed during last day »)

# Studie's main objectives

- Find personal and psychological patterns related to particular substances consumption
- Try to predict the level of risk for different personal and psychological profiles related to particular addictive substances

# Addictive substance abuse : a rampant and unsolved problem of the Humanity

Understanding personal and psychological patterns linked to substance use is crucial today for several reasons:

- **Precision Interventions:** Identifying these patterns helps tailor interventions, making them more effective for individuals with different psychological profiles.
- **Early Identification:** Predicting addiction risks based on these patterns enables early identification and targeted prevention strategies.
- **Informed Policies:** Insights from this research guide policymakers in resource allocation and policy development for more impactful prevention and treatment measures.
- **Reducing Stigma:** Understanding these patterns reduces stigma and fosters a more supportive environment for those dealing with addiction.
- **Advancements in Treatment:** This research contributes to refining theories, creating new tools, and developing innovative treatments for addiction.

*In summary, studying these patterns aids in customizing interventions, early detection, informing policies, reducing stigma, and advancing addiction treatment.*
